(See also AAR73201-592).
                           The present sequence, a pan DR binding peptide, is capable of binding antigen binding sites on MHC molecules, which are encoded by most of the allelss of a DR locus. The peptide can be used to inhibit or induce MHC Class II mediated activation of T-cells or helper T-cells, which themselves mediated activation of T-cells or heper T-cells mammals, especially humans, to inhibit T-cell-mediated events involved in allograft rejection, allergic response and autoimmunity and as a vaccine adjuvant for enhancing an immune response against an administered immunogen. The peptide can be used with other immunogens to treat, e.g. prostate cancer, hepatitis B, hepatitis C, AIDS, renal and cervical carcinoma, lymphoma, CMV and condylyloma acuminatum.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel polypeptide(s) having affinity for the human TSH receptor antibody - used in detection of the TSH antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    thyroid stimulating hormone receptor; TSH; human; Homo sapiens;

The invention relates to human leukocyte antigen (HLA) pan DR-binding peptide comprising a fragment of a stress protein that binds to one or more major histocompatibility complex (MFC) class II molecules. The peptides invention also relates to hat shock protein (hsp) peptides. The peptides of the invention and thr immunomodulating or preventing an immune-compatibility complex treating or preventing an immune-comparison and the mammalian subject e.g. human, having or at risk of having a disease in a mammalian subject e.g. human, having or at risk of the invention arthritis, lugs expthemacosus, mysathenia gravis, type I clabetes, scleroderma, ulcerative colitis, cancer (e.g. melanoma, luman, arcoma and connective tissue cancers) and infectious retinoplastoma, arcoma and connective tissue cancers) and infectious classases. The peptides of the invention are also useful for screening classases. The peptides of the invention are also useful for screening opptides or analogues that modulate pathogenic immune response. These peptides or analogues that modulate pathogenic immune response. These peptides or analogues that modulate pathogenic immune response. These connective tissue disease, primary biliary cirrhosis, pernicious anemia, autoimmune thyroiditis, villigo, idiopathic Addison's disease, gluten-sensitive enteropathy, Gave's disease, inflammatory bowel classase, autoimmune enteropathy also done deposit disease.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                           New artificial antigen presenting cells useful for isolating and expanding T cells, and modulating T cell responses for the treatment of e.g. autoimmune diseases, allergies
                                                                                                                                                                                                                                                                                                                                                                 This synthetic peptide, termed PADRE 965.10, is characterised as a pan-RX binder peptide. PADRES of comparable affinity were used model antigens to identify human antigen. Specific T cells in an experiment designed to identify human antigen. Specific T cells in an artificial antigen presenting cells (APC) is effective in artificial antigen presenting cells (APC) is effective in clambidity in polyclonal class II restricted human T cells. The invention is directed to artificial APC, and methods of making APC used to isolate and expand T cell populations and to modulate T cell responses. The invention also provides novel methods for the identification and isolation and antigen-specific T cells. The methods provide for the construction of liposomes containing MHC:Peptide complexes, accessory molecules, co-stimulatory molecules, addession molecules, and other molecules intrelevant to T cell binding or modulation that are used in the binding of artificial APC to solid support systems that may be used in the retival and identification and antigen-specific T cells. Devices and methods are provided for treating conditions that would benefit from modulation of T cell response, e.g. autoimmune disorders (rehumatoid arthritis, dermatomiosytis, juvenile rheumatoid arthritis, dermatomiosytis, juvenile rheumatoid arthritis, and vertice, viral infections, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human leukocyte antigen; HLA; DR-binding peptide; therapy; stress protein; major histocompatibility complex; MHC; antiulcer; type I diabetes; scleroderma, heat shock protein, hesp; utilingo; rheumatoid arthritis; lupus erythematoeus; myasthenia gravis; tumour; ulcerative colitis; infectious disease; haemostatic; nephrotropic; polymyositis; chronic active hepatitis; primary bilitary cirrhosis; pernicious anaemia; autoimmune thyroiditis; Sjogren's syndrome; cancer; Grave's disease; autoimmune disease; multiple sclerosis; hepatotropic; antimfammatory bowed disease; Goodpasture's syndrome; neuroprotective; antimfammatory bused in munosuppressive; dermatological; antiinflammatory; antiinfertility; idiopathic Addison's disease; cytostatic.

Pan DR-binding peptide activator of T cells.

13-NOV-1995

AAR70249 standard; peptide; 13 AA.

```
The invention relates to an artificial antigen presenting cell (1) accessory wolecule components. (1) is used in methods for the accessory wolecule components. (1) is used in methods for the accessory wolecule components. (1) is used in methods for the collowing: (1) identifying T cells specific for an antigen of interest; (3) modulating T cells specific for an antigen of interest; (3) modulating T cells specific for an antigen of interest; (3) modulating T cells (4) treating a condition in a subject which would be benefited by altering the functional pattern of cytokine production by certain antigen specific T cells to increase T-helper (Th) 2 response and/or decrease Thi response; (6) identifying antigen-specific T cells to increase T-helper (Th) 2 response and/or decrease This response; (6) identifying antigen-specific T cells to certain antigen specific or epitopes on a graft donor's tissue likely to elicit graft versus host rejection response; and (7) treating a recipient mammal to reduce rejection of allografts in a transplantation therapy regime.

CC wish bypass products, juvenile rheumatoid arthritis or uveitis. Alternatively contain infection, bacterial infection. Addition of the accessory or viral infection in the liposomes allow for substantially improved in the identification and manipulation of T cells which is very important in the method of the invention.

CC the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ;

Peptide ARATO249; is capable of binding MHC class II molecules causing T cell activation. This is useful as a vaccine component and may be used in conjunction with CTL peptides to enhance a CTL response.
                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                               ö

This PADRE (pan-DR binding) peptide is used in a composition for eliciting an immune response to a non-protein antigenic determinant. The composition comprises of the PADRE peptide covalently linked to the non-protein antigenic determinant. The composition is used to induce a non-protein antigenic determinant. The composition is used to induce a composition antigenic determinant. The composition is used to induce a polysaccharide antigens associated with tunours or infectious agents. It provides a high level, long-lasting IgG immune response. The composition is also used to produce monoclonal antibodies which are potentially useful as therapeutic and diagnostic agents. The composition can be used to produce monoclonal antibodies which are potentially useful as therapeutic and diagnostic subjects at risk from developing contigent of entigenic determinant or to predict subjects at risk from developing chronic infections. PADRE peptides have broader specificity and higher affinity than known DR-binding peptides. They are powerful inhibitors of the proliferative response of human T cells especial invivo induction of cytotoxic T cells and antibody production.
                                                                                                                                                                                                                                                                                        Composition for eliciting immune response to non-protein determinant - comprises the determinant and a pan-DR binding peptide, used for prevention and treatment of tumours and infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ;

Peptide AAR70250 is capable of binding MHC class II molecules causing T cell activation. This can be used as a vaccine component. The peptide can also be used in combination with CTL peptides to enhance a CTL response.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

                                                                                                The present sequence, a pan DR binding peptide, is capable of binding antigen binding sites on MHC molecules, which are encoded by most of the alleles of a DR locus. The peptide can be used to inhibit or induce MHC Class II mediated activation of T-cells or helper T-cells, which themselves mediate a CTL response. The peptide can be used in mammals, especially humans, to inhibit T-cell-mediated events involved in allograft rejection, allergic responses and autoimmunity and as a vaccine adjuvant for enhancing an immune response against an administered immunogen. The peptide can be used with other immunogens to treat, e.g. prostate cancer, hepatitis B, hepatitis C, AlDS, renal and cervical carcinoma,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Peptides that bind to MHC molecules of all DR alleles - inhibiting or inducing MHC Class II mediated activation of T cells

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This PADRE (pan-DR binding) peptide is used in a composition for eliciting an immune response to a non-protein antigenic determinant. The composition comprises of the PADRE peptide covalently linked to the composition comprises of the PADRE peptide covalently linked to the non-protein antigenic determinant. The composition is used to induce a construction and the padre polysaccharide antigens associated with tunours or infectious agents. It provides a high level, long-lasting IgG immune response. The composition is also used to produce amonoclonal antibodies which are potentially useful as therapeutic and diagnostic agents. The composition can be used to diagnose susceptibility of a patient to treatment with the non-protein chronic infections. PADRE peptides have broader specificity and higher effonts than known DR-binding peptides. They are powerful inhibitors of the proliferative response of human T cells restricted by at least 6 different DR molecules, and act as helper epitopes of in vivo induction of cytotoxic T cells and antibody production.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          .;

These involve the use of interleukin-5 (IL-5) analogues and modified IL-5 proteins and their coding sequences to down-regulate IL-5 activity and thus reduce eosinophil numbers. The allergic diseases may be treated using autovaccines, nucleic acid vaccines or live vaccines. In addition, it is possible that they may be used in the treatment of cancer and helminthic infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Asthma; IL-5; interleukin-5; allergy; cytokine; helminthic infection; cancer; eosinophilia; vaccine; allergic rhinitis.

            peptide can be used in mammals, especially humans, to inhibit T-cell-mediated events involved in alloggraft rejection, allergic responses and autoimmunity and as a vaccine adjuvant for enhancing an immune response against an administered immunogen. The peptide can be used with other immunogens to treat, e.g. prostate cancer, hepatitis B, hepatitis C, AIDS, renal and cervical carcinoma, lymphoma, CMV and condylyloma acuminatum.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Down-regulating interleukin 5 (IL-5) activity in humans by administering IL-5 and/or an IL-5 analogue, useful in the treatm prophylaxis or amelioration of asthma or other chronic allergic

universal HTL epitopes, or a cycloxic Tlymphocyte (CTL) epitope and a universal HTL epitopes uch as a pan DR epitope (PADRE). The vectors are useful for stimulating an immune response in vivo, as well as for use in assaying the human immunogenicity of a human T cell peptide epitope in vivo in a non-human mammal. They provide a nucleic acid vaccine for enhancing immunity against infectious pathogens, such as viruses (e.g., HIV, hepatitis B (HBV and hepatitis C (HVV)) bacteria, protozoa (e.g., Plasmodium falciparum, the cause of malaria) and also tumour cells and autoimmune diseases. Universal MHC class II epitopes are advantageously combined with other MHC class I and class II epitopes to increase the number of cells that are acctivated in response to a given antigen and provide a broader population coverage of MHC-reactive alleles.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This sequence represents a universal helper T epitope, pan DR epitope (PADRE), DNA encoding which is used to construct fusion genes used in exemplifications of the present invention. The invention relates to a novel expression vector comprising a promoter operably linked to a fusion gene encoding a major histocompatibility complex (MHC) targetting sequence, and two or more hererologous peptide epitopes. The MHC targetting sequence may be a class I targetting sequence, which directs an MHC class I epitope to a cytosolic pathway or to the endoplasmic reticulum, or an MHC class II targetting sequence, which directs extracellular antigens to enter the endocytic pathway to be processed into antigen peptides for presentation on MHC class II molecules. The heterologous epitopes may comprise either helper I

The invention relates to a method of determining the surface density of a cell-surface molecule on a primary or artificial antigen-presenting cell capto. The method comprises determining the cell surface area as cell capto. The method comprises determining the cell surface molecule to the APCs, determining the absolute amount of cell surface molecule to the APCs surface area as a measure of cell surface molecule to the APC surface area as a measure of cell surface molecule to the APC surface area as measure of cell surface molecule to the APC surface area as measure of cell surface molecule to the APC surface density of a complex of peptide and MHC (major histocompatibility complex) protein/peptide complex on an APC; dentifying an agent that increases persistence of the MHC/peptide complex on an APC surface by culturing APCs in presence of test compound and measuring the time of persistence relative to an untreated control; and determining if the APC carries a therapeutically adequate amount of peptide by determining whether the cell-surface density of the MHC/peptide complex is 100 molecules/square micrometre or more. The method is used to determine if the amount of MHC/antigenic peptide complex present on the surface of an APC is sufficient for therapeutic antigen-specific T cells for subsequent return to the patient, can pertiant also be used to identify agents that increase the production of MHC/peptide complexes on cells, (which increases the therapeutic potential of the cells) by treatment before and/or during
                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Determining surface density of molecules on antigen-presenting cells, useful for quality control of cellular vaccines for treatment of tumors and infections comprises measuring density ratios -

```
CC aptC administration. The method allows identification of therapeutically CC useful artigan-pulsed APC optimisation of conditions for their creptacion, and control of APC quality. Sequences AAB9364-AAB93646 CC represent peptides used in MHC binding studies and for the generation CC of peptide-specific cytotoxic T-lymphocytes.

Ayporthetical protein 2 - garlic mosaic virus
C;Species: garlic mosaic virus, GarMV
C;Species: garlic mosaic virus, GarMV
C;Species: garlic mosaic virus, GarMV
C;Date: 20-Feb-1995 #sequence_revision 20-Feb-1995 #text_change 08-Oct-1999
C;Accession: S23863
A;Cobi, Y. H.; Choi, Y. H.; Choi, Y. D.; Lee, J.S.
A;Description: Nucleotide sequence of a cDNA for garlic mosaic virus.
A;Recence number: S23862
A;Cocssion: S23863
A;Accession: S23863
A;Cocssion: S23863

Pypothetical protein APE0390 - Aeropyrum pernix (strain K1)
C;Species: Aeropyrum pernix
C;Accession: E32731
R;Kawarabayasi, Y.; Hino, Y.; Horikawa, H.; Yamazaki, S.; Haikawa, Y.; Jin-no, K.; Takahawa, H.; Takamiya, M.; Masuda, S.; Punahashi, T.; Tanaka, T.; Kudoh, Y.; Jin-no, K.; Takahawa, H.; Takamiya, M.; Masuda, S.; Punahashi, T.; Tanaka, T.; Kudoh, Y.; Jin-no, K.; Takahawa, T.; Lile: Complete genome sequence of an aerobic hyper-thermophilic Crenarchaeon, Aeropyrula, A;Accession: E72731
A;Accession: E72731
A;Status: preliminary
A;Molecule type: DMA
                                                                                                                                                                                                                                                                                                                                                                                                              hypothetical protein SSO1384 [imported] - Sulfolobus solfataricus transposon ISC1078 C; Species: Sulfolobus solfataricus complete genome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ó

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Peptides with affinity to human TSH (thyroid stimulating hormone) receptor antibody are used for detection of the antibody. (See also AAR73201-592).
                                        The present sequence, a pan DR binding peptide, is capable of binding antigen binding sites on WHC molecules, which are encoded by most of the alleles of a DR locus. The peptide can be used to inhibit or induce WHC Class II mediated activation of T-cells or helper T-cells, which themselves mediate a CTL response. The peptide can be used in mamals, especially humans, to inhibit T-cell-mediated events involved in allograft rejection, allergic responses and autoimmunity and as a vaccine adjuvant for enhancing an immune response against an administered immunogen. The peptide can be used with other immunogens to treat, e.g. prostate cancer, hepatitis B, hepatitis C, AlDS, renal and cervical carcinoma,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel polypeptide(s) having affinity for the human TSH receptor antibody - used in detection of the TSH antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 thyroid stimulating hormone receptor; TSH; human; Homo sapiens;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

                                                                                                                              New artificial antigen presenting cells useful for isolating and expanding T cells, and modulating T cell responses for the treatment of e.g. autoimmune diseases, allergies
                                                                                                                                                                                                                         This synthetic peptide, termed PADRE 965.10, is characterised as a pan-IR binder peptide. PADREs of comparable affinity were used as model antigens to identify human antigen-specific T cells in an experiment designed to dennify human antigen-specific T cells in an artificial antigen presenting cells (AFC) is effective in artificial antigen presenting cells (AFC) is effective in identifying polyclonal class II restricted human T cells. The invention is directed to artificial APC, and methods of making APC used to isolate and expand T cell populations and to modulate to used to isolate and expand and antigen-specific T cells. The identification and isolation and antigen-specific T cells. The identification and isolation and entire modulation flapsomes containing MHC:peptide complexes, accessory molecules, co-stimulatory molecules, adhesion molecules, and other molecules irrelevant to T cell binding of modulation that are used in the binding of artificial APC to solid support systems that may be used in the retival and identification and antigen-specific T cells. Devices and methods are provided for treatmental that may be used in the from modulation of T cell response, e.g. autoimmune disorders (from modulation of T cell response, e.g. autoimmune disorders (specially type I diabetes mallitus, multiple sclerosis, and arthritis, dermacomiosytis, juvenile rheumatoid arthritis, dermacomiosytis, virel infections, and arthritis, dermacomiosytis, virel infections, and arthritis, dermacomiosytis, virel infections, and

more major nistocomparibility complex (mile) class in mustectures. In more major nistocomparibility complex (mile) classes. The peptides control and the immunomodulating composition comprising these confined are useful for medulating, treating or preventing an immunementated disease in a mammalian subject e.g. human, having or at risk of having a disease including autoimmune disease, multiple sclerosis (MS), remembroid archititis, lugus erythemacosus, myasthemia gravis, type I diabetes, scleroderma, ulcerative colitis, cancer (e.g. melanoma.) ymphoma, leukaemia, lung, liver kidney, brain, bladder solid tumours, retinoblastoma, sarcoma and connective tissue cancers) and infectious cliseases. The peptides of the invention are also useful for screening cliseases. The peptides of the invention are also useful for screening competides are useful for treating autoimmune response. These peptides are useful for treating autoimmune response. These including Sjogren's syndrome, polymyositis, chronic active hepatitis, anaemia, autoimmune hubyroiditis, vitiligo, idiopathic Addison's disease, connective tissue disease, primary bilary cirrhosis, pernicious connective tissue disease, primary bilary cirrhosis, pernicious connective tissue disease, primary bilary cirrhosis, pernicious connective uncommune reluctopenia, idiopathic thromobocytopaenia purpura, pemphigus vulgaris, autoimmune infertility, Goodpasture's syndrome, pemphigus vulgaris, autoimmune infertility, Goodpasture's syndrome, pemphigus vulgaris, autoimmune infertility, Goodpasture's syndrome, pemphigus and ense in PADRE, a pan-DR binder peptide used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel human leukocyte antigen pan DR-binding peptide, useful for treating immune mediated diseases and conditions, has a fragment of stress protein that binds to major histocompatibility complex class II
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to human leukocyte antigen (HLA) pan DR-binding peptide comprising a fragment of a stress protein that binds to one or more major histocompatibility complex (MHC) class II molecules. The invention relates to an artificial antigen presenting cell (1) comprising liposome, major histocompatibility complex (MHC), antigen an accessory molecule components. (1) is used in methods for the components. (2) isolating T cells specific for an antigen of interest; (3) modulating T cells specific for an antigen of interest; (3) modulating T cell response; (4) characterising the functional state of antigenspecific T cells; (5) treating a condition in a subject which would be specific T cells; (5) treating a condition in a subject which would be certain antigen-specific T cells to increase T-helper (Th) 2 response and/or decrease Th1 response; (6) identifying antigen-specific T cells specific T cells to increase T-helper (Th) 2 response specific for epitopes on a graft donor's tissue likely to elicit graft versus host rejection of allografts in a transplantation therapy regime.

Method (5) is useful for treating autoimmune disease such as type I diabetes mellitus, multiple sclerosis, rheumatoid arthritis, cit is useful for treating altersy due to altergans such as dust, animal skin bypass products, vegetables, fruits, pollen or chemicals, cancer, viral infection, bacterial infection, Addition of the accessory molecules, as well as co-stimulatory molecules, and other proteins in proper orientation in the liposomes allow for the subscueding the content of the co
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ·

Peptides capable of binding MHC class II molecules via antigen binding sites (pan DR-binding peptides) were synthesised. Peptide ARAN70249 is capbale of binding MHC class II molecules causing T cell activation. This is useful as a vaccine component and may be used in conjunction with CTL peptides to enhance a CTL response.

This PADRE (pan-DR binding) peptide is used in a composition for eliciting an immune response to a non-protein antigenic determinant. The composition comprises of the PADRE peptide covalently linked to the non-protein antigenic determinant. The composition is used to induce a conference of the padre particularly to selected the paper polysaccharide antigenic response, particularly to selected polysaccharide antigens associated with tumours or infectious agents It provides a high level, long-lasting IgG immune response. The composition provides a high level, long-lasting IgG immune response. The composition of a slave used to produce monoclonal antibodies which are potentially useful as therapeutic and diagnostic agents. The composition can be used antigenic and diagnostic subjects at risk from developing contingent celetraniant or to predict subjects at risk from developing chronic infections. PADRE peptides have broader specificity and higher affinity than known DR-binding peptides. They are powerful inhibitors of the proliferative response of human T cells restricted by at least 6 different DR molecules, and act as helper epitopes of in vivo induction contents.
                                                                                                                                                                                  Composition for eliciting immune response to non-protein determinant - comprises the determinant and a pan-DR binding peptide, used for prevention and treatment of tumours and infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Peptides capable of binding MHC class II molecules via antigen binding sites (pan DR-binding peptides) were synthesised. Peptide AAR70250 is capable of binding MHC class II melecules causing T cell activation. This can be used as a vaccine component. The peptide can also be used in combination with CTL peptides to enhance a CTL response.

                                                                                                         The present sequence, a pan DR binding peptide, is capable of binding antigen binding sites on MHC molecules, which are encoded by most of the alieles of a DR locus. The peptide can be used to inhibit or induce MHC Class II mediated activation of T-cells or halper T-cells, which themselves mediate a CTL response. The peptide can be used in mammals, especially humans, to inhibit peptide can be used in mammals, especially humans, to inhibit re-cell-mediated events involved in allograft rejection, allergic responses and autoimmunity and as a vaccine adjuvant for enhancing an immune response against an administered immunogen. The peptide can be used with other immunogens to treat, e.g. prostate cancer, hepatitis B, hepatitis C, AIDS, renal and cervical carcinoma, lymphoma, CMV and condylyloma acuminatum.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Peptides that bind to MHC molecules of all DR alleles - inhibiting or inducing MHC Class II mediated activation of T cells
             Peptides that bind to MHC molecules of all DR alleles - inhibiting or inducing MHC Class II mediated activation of T cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence, a pan DR binding peptide, is capable of binding antigen binding sites on MMC Molecules, which are encoded by most of the alleles of a DR locus. The peptide can be used to by most of the alleles of a DR locus. The peptide can be used to inhibit or induce MHC Class II mediated activation of T-cells or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           .,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This PADRE (pan-DR binding) peptide is used in a composition for eliciting an immune response to a non-protein antigenic determinant. The composition comprises of the PADRE peptide covalently linked to the composition comprises of the PADRE peptide covalently linked to the non-protein antigenic determinant. The composition is used to induce a conjugate of prophylactic response, particularly to selected polysaccharide antigens associated with tumours or infectious agents. It provides a high level, long-lasting IgG immune response. The composition is also used to produce monoclonal antibodies which are potentially useful as therapeutic and diagnostic agents. The composition can be used to diagnose susceptibility of a patient to treatment with the non-protein chiganose susceptibility of a patient to treatment with the non-protein chronic infections. PADRE peptides have broader specificity and higher affinity than known DR-binding peptides. They are powerful inhibitors of the proliferative response of human T cells restricted by at least 6 clifferent DR molecules, and act as helper epitopes of in vivo induction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

These involve the use of interleukin-5 (IL-5) analogues and modified IL-5 proteins and their coding sequences to down-regulate IL-5 activity and thus reduce eosinophil numbers. The allergic diseases may be treated using autovaccines, nucleic acid vaccines or live vaccines. In addition, it is possible that they may be used in the treatment of cancer and

helper T-cells, which themselves mediate a CTL response. The peptide can be used in mammals, especially humans, to inhibit T-cell-mediated events involved in allograft rejection, allergic responses and autoimmunity and as a vaccine adjuvant for enhancing an immune response against an administered immunogen. The peptide can be used with other immunogens to treat, e.g. prostate cancer, hepatitis B, hepatitis C, AlDS, renal and cervical carcinoma, Iymphoma, CMV and condylyloma acuminatum.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention is concerned with methods of treating asthma,

Threat transfer a fusion gene encoting a major instrocompatibility complex.

(MHC) targetting sequence, and two or more heterologous peptide epitopes. The MHC targetting sequence may be a class I targetting sequence, which directs an MHC class I epitope to a cytosolic pathway or to the endopaliasmic reticulum, or an MHC class II targetting sequence, which candoplasmic reticulum, or an MHC class II targetting sequence, which candoplasmic reticulum, antigens to enter the endocytic pathway to be processed into antigen peptides for presentation on MHC class II molecules. The heterologous epitopes may comprise either helper T molecules. The heterologous epitopes may comprise either helper T molecules. The heterologous epitopes may comprise either helper T withouters HTL epitope such as a pan DR epitope (PADRE). The vectors are universal HTL epitope such as a pan DR epitope (PADRE). The vectors are useful for stimulating an immune response in vivo, as well as for use in vivo in a non-human mammal. They provide a nucleic acid vaccine for vivo in a non-human mammal. They provide a nucleic acid vaccine for the non-human mammal. They provide a nucleic acid vaccine for vivo in a non-human mammal. They provide a nucleic acid vaccine for the nucleic manulity against infectious pathogens, such as viruses (e.g., Plasmodium falciparum, the cause of malaria) and also tumour cells and cautoimmune diseases. Universal MHC class II epitopes are advantageously combined with other MHC class I and class II epitopes to increase the provide a broader population coverage of MHC-reactive alleles.
                                                                                                                                                                                                                                                                                                                                                                                             Chimeric; Ii protein; pan DR epitope; expression vector; promoter; major histocompatibility complex; MHC; targetting; peptide; epitope; antigen; presentation; class I; cytosolic pathway; endoplasmic reticulum; class II; extracellular antigen; endocytic pathway; helper T lymphocyte; HTL; universal epitope; cytocoxic T lymphocyte; CTL; immune response; immunogenicity; assay; vaccine; immunity; infection; pathogen; virus; HIV; HBV; HCV; hepatitis B; hepatitis C; bacterium; protozoan; tumour cell; autoimmune disease; activation; antiviral; antimalarial;

DNA encoding which is used to construct fusion genes used in exemplifications of the present invention. The invention relates to a novel expression vector comprising a promoter operably linked to a fusion gene encoding a major histocompatibility complex
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Livingston B;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Expression vectors encoding major histocompatibility targeting

The invention relates to a method of determining the surface density of a cell-surface molecule on a primary or artificial antigen-presenting cell surface molecule on a primary or artificial antigen-presenting cell surface area as early of the APCs. The method comprises determining the cell surface area as a measure of cell surface molecule to the APC surface area as a measure of cell surface molecule to the APC surface area as a measure of cell surface molecule to the APC surface area as a measure of cell surface molecule to the APC surface area as a measure of cell surface molecule to the APC surface area as a measure of cell surface molecule to the APC surface density of a complex of peptide and MHC (major histocompatibility complex) protein/peptide complex on an APC; identifying an agent that increases persistence of the MHC/peptide complex on an APC surface by culturing APCs in presence of test compound complex on an APC surface by culturing APCs in presence of the Compound of Deptide complex is 100 molecules/square molecules. The complex present on the surface of an APC is sufficient for therapeutic complex is so cellular vaccines or for ex vivo expansion of antigen-specific T cells for subsequent return to the patient, cancines. The complex present on the surface of an APC is sufficient for therapeutic complex present of tumours or vivo expansion of antigen-specific T cells for subsequent return to the patient, cancines. The complex present of two or so are in the surface of an APC is sufficient for therapeutic complex present or the treatment of tumours or vivo expansion of antigen-specific T cells for subsequent return to the patient, cancined the complex or also be used to identify agents that increase the production of MHC/peptide complexes on cells, (which increases the therapeutic potential of the cells) by treatment before and/or during
                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Determining surface density of molecules on antigen-presenting cells, useful for quality control of cellular vaccines for treatment of tumors and infections comprises measuring density ratios -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Length 13;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0; Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   US-09-949-375A-18

Sequence 18, Application US/09949375A

Patent No. US20020172673A1

GENERAL INFORMATION:

APLICANT: KAYSNER, Steen et al.

TILLE OF INVENTION: METHOD FOR DOWN-REGULATING IGE

FILE REFERENCE: 3631-0111P

CURRENT APPLICATION NUMBER: US/09/949,375A

CURRENT FILING DATE: 2002-01-18

NUMBER OF SEQ ID NOS: 38

SOFTWARE: PatentIn Version 3.1

SEQ ID NO 18
